Waveshaper is a software which can be used to optimize the sound of your music in order to get the desired effect. It is useful for many purposes. For example, it can help reduce sound distortions at high volume levels, optimize sound at different levels or make audible noises disappear. Optimizing sound Let's start with the main function of the program: optimizing sound. To do this, Waveshaper has presets, which include various parameters. However, you are free to define them to your liking by dragging slider bars on the various graphically displayed parameters. Pre-configured settings Waveshaper includes many different types of sound profiles. However, the most important are the following: Normal This setting has everything set to normal. Gain You can set the volume level in two ways: either by using a direct value, or by using a curve. The volume of your music will increase from a low level to a high level, with a certain level of intensity at each step. Reverberation This setting allows you to choose the intensity of the reverb on your sound. Panorama This setting gives you control over the width and the volume of the stereo panorama. Notch This setting limits the frequency range of your sound, thus making it sound less noisy. The sound of music that has been optimized according to the settings you choose will sound more coherent and pleasant. Adjustment of volume Waveshaper allows you to adjust the volume of your music. This way, you can reach louder and softer volumes, and all sound levels will be well represented. You can drag the sliders on the graphically displayed window to set the volume level in different ways. Curve There are two ways to set the volume levels with the help of a graph: a direct graph and a curved graph. The curved graph allows you to adjust the volume more quickly and accurately. Sound & mixing Now let's take a look at the other section of this program. It includes a microphone mixer and two graphic displays, which help you determine the frequency of sound waves that are being recorded. Microphone mixer This feature allows you to adjust the input level and the input channel, as well as to set the microphone gain. As you adjust the slider bars, you can see the corresponding waveform, which helps you determine the level of the sound and
